1 Access Control Models and Mechanisms: The tees confidentiality model: an authorisation model for identities and roles

Jim Longstaff, Mike Lockyer, John Nicholas

June 2003 **Proceedings of the eighth ACM symposium on Access control models and technologies**Full text available: [pdf\(401.69 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

We present a model of authorisation that is more powerful than Role Based Access Control (RBAC), and is suitable for complex web applications in addition to computer systems administration. It achieves its functionality by combining Identity Based Access Control (IBAC) and RBAC in novel ways. A particular feature of the model is a rigorous definition of override, for granting access to data and resources in exceptional circumstances. Despite its power, the model can be implemented by a single al ...

2 Improving the granularity of access control for Windows 2000

Michael M. Swift, Anne Hopkins, Peter Brundrett, Cliff Van Dyke, Praerit Garg, Shannon Chan, Mario Goertzel, Gregory Jensenworth

November 2002 **ACM Transactions on Information and System Security (TISSEC)**, Volume 5 Issue 4Full text available: [pdf\(447.78 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#), [review](#)

This article presents the mechanisms in Windows 2000 that enable fine-grained and centrally managed access control for both operating system components and applications. These features were added during the transition from Windows NT 4.0 to support the Active Directory, a new feature in Windows 2000, and to protect computers connected to the Internet. While the access control mechanisms in Windows NT are suitable for file systems and applications with simple requirements, they fall short of the ...
